

# Application Snapshot

## Industry – Building warehouse

### The Problem

Manufacturing timber trusses, cabinents and beams – creates saw dust on the ground and in the air.

Add to this fabricating structural steel – so the cutting, grinding and welding of steel – and then a paint booth – you have a warehouse that MUST be clean

Being a brand new warehouse build – there are open sites with dust being blown around next door - and that comes in through the open roller doors.

### The Solution

Getting staff to clean is always a problem on the best days. So going to the Hako Sweepmaster B800R was a no brainer. Battery powered, with the patented DUST STOP side broom cover – the factory has never been cleaner.

Saw dust and steel swarf picked up in no time. No more debris left on steel or timber items before painting. Being a ride on – there is no more manually pushing a broom.

Our unit was chosen over others as it had the better ergonomics for the operators (being broad builds over 6 foot tall) and better sweep results.

LED light for safety, and reverse beeper were added to allow use without the need to stop full factory operations.

### The Benefits

- No more dust on high value product.
- Clean production area – reduction in the need to clean product before paint.
- Reduction of health issues – less sick days.
- Staff “want” to clean now as it is not a “chore”.
