

Application Snapshot

Industry – Civil plant workshop

The Problem

When you undertake large civil construction – you need large plant equipment. To look after that equipment you need a large open warehouse & fabrication area.

With the large open warehouse – you have wind blown dirt and rubbish PLUS the debris from the large plant equipment.

Over the dryer months that dirt is blown around as dust – and in the wetter times it is clay and mud.

All of this MUST be cleaned up. (Better picked up in the warehouse than a workshop bay) If left to build up – it blows around as a health issue as well as to sit on top of product and vehicles left stored in the shed.

The Solution

For bulk dust and clumps of clay a Hako PowerBoss 6X LPG sweeper was deployed. Running LPG means inside a large open shed – for effective cleaning and rubbish pick up.

Built tough with a heavy steel chassis – the PowerBoss match the CAT excavators, ISUZU trucks and large steel fabrication bays well.

The Benefits

- With large plant – time is MONEY and the quicker machines can be serviced and back in field operation - the happier the customer.
- Product with out dust on heads to site in better condition – and can be used immediately – without needing to be cleaning or reworked.
