

The Problem

Running a high volume warehouse – means lots of pallet movements – which means lots of open doors and forklift movements.

Open rollers doors allows windblown dust and debris onto your product (or in this case the 3PL clients products). Rubbish was also blowing on to the hardstand from surrounding roads & making the site look like a rubbish tip!

Looking to expand their offering to 3PL clients – the site needs to look SPOT ON! So both rubbish & dust control is of CRITICAL importance.

The Solution

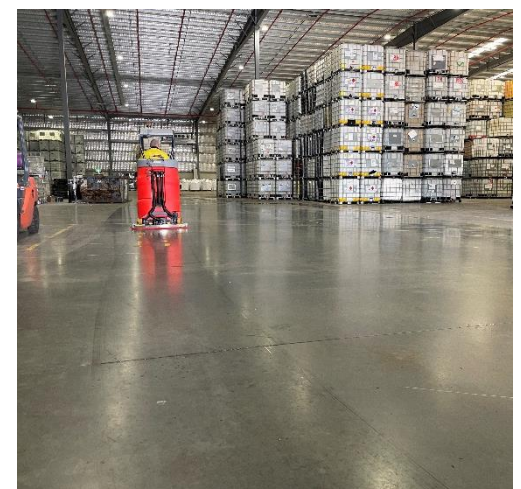

To collect the dust and rubbish from the hardstand and inside the warehouse a Hako Sweepmaster LPG1500 twin brush unit was installed. With LPG forklifts on site – this was an easy fuel source.

The twin brush unit gives a broad sweep path – combined with the DUST STOP brush covering for keeping airborne dust to a minimum. Just one pass outside on dellivery yielded telling results!

To keep the new concrete factory floor up to a high standard a Hako Scrubmaster B175R scrubber was installed. Battery powered, ride on and with squirter wash down hose – this allows for a clean, residue free floor. No manual mopping needed!

The Benefits

- Less rubbish outside – which means less being blown into the warehouse.
- No chemical or waste residue on the inside floors – making a safer operation area for staff.
- Forklift wheel slip and tyre wear reduced
